2 Kurzbericht

Haaranalyse ist die chemische Analyse einer Haarprobe. Haare müssen vor allem dann für retrospektive Analysen verwendet werden, wenn Blut und Urin nicht mehr die erwartete Substanz beinhalten, typischerweise z.B. nach einem Jahr. Die am meisten verbreitete akzeptierte Anwendung ist im Feld der forensischen Toxikologie und der Umwelttoxikologie. Verschiedene alternativmedizinische Bereiche nutzen ebenfalls Haaranalysen, aber diese Verwendung wird kontroversiell gesehen, da sie nicht standardisiert ist.

Die Haarprobe wird auf Inhalt von Mineralien, Metallen, Drogen, Medikamente und andere Substanzen getestet.

In der medizinischen Literatur (gesucht in Pubmed und Cochrane Database for CCT) existieren Studien auf Level 1-6 (nach der Skala der American Heart Association) für

- Drogen-, Alkohol-, Tabak- und Medikamententests
- Substanztests (Zinn, Magnesium, Kupfer, Blei, Uran, Schwermetalle)
- DNA Testung
- Dopingtests bei Sportlern
- Zusammenhang zwischen Krebs und Haarpflegeprodukten
- Unterschiede zwischen Haartypen
- Validitätsstudien der Haaranalyse
- Ernährungseinfluss auf Substanzveränderung

In alternativen pseudomedizinischen Angeboten wird die Haaranalyse zur Früherkennung diverser Krankheiten und Zustände (*sich anbahnenden Schäden, bei Haarausfall, Haarproblemen, Hauterkrankung, Neurodermitis, Herzkrankheit, brüchigen Nägel, Diät, Stoffwechselerkrankungen, bei allen unspezifischen Beschwerden, Fettleibigkeit, Störungen der Enzymsysteme oder Organe, Osteoporose usw.*) durchgeführt. Für diese Art der Anwendung wurden keine wissenschaftlichen Artikel gefunden, die Evidenz hierfür scheint keinen der Level der AHA zu erreichen.

Zur validen Beantwortung der Frage sollte diese genauer eingegrenzt werden:

- **Art der Haaranalyse (DNA Test, Substanztest, Mikroskopanschau)**
- **Zweck der Haaranalyse (Diagnose welcher Art von Krankheiten)**
- **Zielpopulation für die Haaranalyse**

3 Fragestellung

Die Methode der Haaranalyse soll bewertet werden.

Die Bewertung selbst soll nach einer Skala der American Heart Association <http://www.americanheart.org/presenter.jhtml?identifier=1200000> erfolgen, die zwischen folgenden 8 Levels unterscheidet:

- Level 1: Statistisch signifikante, randomisierte, kontrollierte Studien (Doppelblindstudien) oder Metaanalysen
- Level 2: Statistisch nicht signifikante, randomisierte, kontrollierte Studien (Doppelblindstudien) oder Metaanalysen
- Level 3: Prospektive, kontrollierte, aber nicht randomisierte Kohorten-Studien
- Level 4: Historische, nicht randomisierte Kohorten- oder Fall-Kontroll-Studien
- Level 5: Verlaufsstudien und Patienten
- Level 6: Tierexperimentelle Studien und mechanistische Modellstudien
- Level 7: Vernünftige Extrapolation von existierenden Daten
- Level 8: Rationale Vermutung

4 Definition

Haaranalyse ist die chemische Analyse einer Haarprobe. Haare müssen vor allem dann für retrospektive Analysen verwendet werden, wenn Blut und Urin nicht mehr die erwartete Substanz beinhalten, typischerweise z.B. nach einem Jahr. Die am meisten verbreitete akzeptierte Anwendung ist im Feld der forensischen Toxikologie und der Umwelttoxikologie. Verschiedene alternativmedizinische Bereiche nutzen ebenfalls Haaranalysen für Umwelttoxikologie, aber diese Verwendung wird kontroversiell gesehen, da sie nicht standardisiert ist.

Haaranalyse kann sich auf die forensische Technik der Bestimmung einer Anzahl verschiedener Haarcharakteristika hinsichtlich Gemeinsamkeiten beziehen, z.B. für den Vergleich von Haaren am Tatort eines Verbrechens mit den Haaren eines Verdächtigen.

Haaranalyse wird ebenso angewandt zur Entdeckung verschiedener therapeutischer und anderer Drogen wie Heroin, Benzodiazepine und Amphetamine. In diesem Kontext wird sie auch zur Compliancemeasurement therapeutischer Drogenentzugsregimes oder zur Kontrolle von Aussagen, dass keine Drogen eingenommen wurden, verwendet. Haaranalyse ist eine zunehmend verwendete Methode zur Kontrolle von Substanzmissbrauch, vor allem auch in Rechtsprozessen, oder in Bereichen, wo Personen der unwahren Aussage zu ihrer Drogenvergangenheit verdächtigt werden.

Haaranalyse wird in der Arbeitsmedizin, Umweltmedizin und einigen Bereichen der Alternativmedizin als zusätzliche Screening- oder Diagnose Methode genutzt. Die Haarprobe wird auf Inhalt von Mineralien und Metallen getestet, die Werte werden mit Expositionen verglichen. Manche Verfechter behaupten, dass damit ebenso Mineraldefizite diagnostiziert werden können, und dass autistische Menschen einen abnormalen Haarmineralgehalt haben¹.

5 Zum Thema Haaranalyse finden sich in Google

- Angebote für Drogentests: *Drogen und Medikamente lagern sich über die Haarwurzel im Haar ein und wachsen mit. Da Haare ca. 10-15 mm im Monat wachsen, kann über entsprechende Segmentierung der Haare auf einen zurückliegenden Konsum geschlossen werden. Zur Untersuchung benötigt man ein kugelschreiberdickes Haarbüschel, welches direkt an der Kopfhaut abgeschnitten wird. Einzelne Haare eignen sich nicht zur Untersuchung².*
- Wege zum Wohlbefinden: *Die Haaranalyse kann Klarheit über Ihren Mineralstoff- und Spurenelementhaushalt bringen. Toxische Stoffe können meist erkannt und natürlich ausgeschieden werden. Durch das langsame Wachstum des Haares können die ermittelten Resultate einer Haaranalyse wesentlich aussagekräftiger als bei Blut- oder Urinuntersuchungen sein, da diese lediglich die Werte des Entnahmetages anzeigen können³. (Auf der Seite wird darauf hingewiesen, dass aus rechtlichen Gründen keine Bestellungen aus Deutschland angenommen werden)*
- Mineralmedizinische Diagnostik: *Ratsam als Vorsorgeuntersuchung zur Früherkennung von sich anbahnenden Schäden, bei Haarausfall, Haarproblemen, Hauterkrankung, Neurodermitis, Herzkrankheit, brüchigen Nägeln, Diät, Stoffwechselerkrankungen (z. B. Diabetes), bei allen unspezifischen Beschwerden, Fettleibigkeit, Störungen der Enzymsysteme oder Organe, Osteoporose usw⁴.*
- Angebote für Vorsorgeuntersuchung: *Ihre Haaranalyse zeigt Unter- wie Überversorgungen und damit Disharmonien bzw. Belastungen noch lange bevor allfällige Krankheitssymptome auftreten. Bei der Haaranalyse wird Ihr Haar auf 30 Mineralstoffe, Spurenelemente und Schwermetalle untersucht⁵.*
- Und weitere ähnliche kommerzielle Verwendungen
